Reporting upstream

v1.4.0-docs.1
target template v1.4.0

> One page for downstream projects reporting bugs/features upstream. Policy: DOWNSTREAM FEEDBACK.

WHERE TO REPORT

REPORT	CHANNEL
Bug	GitHub issue form **Downstream bug report**
Feature	GitHub issue form **Downstream feature request**
Vulnerability	**Never public** — Security tab → Report a vulnerability (private reporting enabled); SECURITY.md
Question/usage	Docs first (HOW TO USE, TROUBLESHOOTING)

Issue forms: `https://github.com/presljf/github-project-tracker/issues/new/choose`

BUG VS FEATURE

	BUG	FEATURE
Report	Actual behavior contradicts documented behavior	Problem/use case not covered
Required	Repro + expected vs actual + versions	Problem, desired behavior, alternatives
Outcome	Fix in patch/minor, with upgrade note	Accepted, deferred, or needs-info decision

MUST INCLUDE

- □ Originating project/program + repository link.
- □ Pinned **exact** tracker version (`automation.templateVersion`); supported versions are listed in SECURITY.md.
- □ Environment: OS, Node, `gh`, shell/runner.
- □ What happened; reproduction steps or minimal example.
- □ Expected vs actual behavior (logs with secrets redacted).
- □ Impact and any workaround.
- □ Downstream issue/PR link.

TRIAGE AND FOLLOW-THROUGH

1. Maintainer sets Project **Source**, labels `source:downstream` + `status:needs-triage`.
2. Type/Area/Kind/Estimate/Release/Sprint set; decision posted: accept, defer, or needs-info.
3. Fix ships under patch/minor/major versioning; release notes + changelog updated.
4. Downstream opens an upgrade issue, blocked by the upstream release when needed.
5. Upgrade deliberately: read migration notes, update the exact pin, validate, record evidence.

VERSIONING AND NO-FORK POLICY

CHANGE	VERSION
Compatible fix	Patch `v1.0.x`
Compatible feature	Minor `v1.1.0`
Breaking change	Major `v2.0.0` + migration notes

- Pin an exact version; never track `main`; no forks — document temporary workarounds with an upstream issue link.
- Small, well-scoped PRs are welcome; larger changes need an upstream issue first and must pass CI.
- Support is best effort, **no SLA**. No secrets, tokens, or vulnerability details in public issues.
