Task lifecycle

v1.4.0-docs.1
target template v1.4.0

> Move a task from Todo to Done without hidden work. Full procedure: HOW TO USE §7–10.

FLOW

`Todo → In Progress → In Review → Done`; side path `In Progress ↔ Blocked`; a reopened `Done` item gets a dated comment and goes back to Todo/In Progress.

1. START — DEFINITION OF READY

- Goal/non-goals clear; acceptance criteria testable.
- Test/evidence plan named; dependencies/blockers linked and resolved.
- Fields set: Release, Sprint, Area, Kind, Estimate; Source if downstream.
- Native type present; no unresolved blocker.

Then: assign owner → Status **In Progress** → post check-in (owner, executor, branch, HEAD, scope, evidence plan) → branch `task/<issue>-<slug>` from `main` → WIP = 1.

2. DURING WORK

- Commit `task(#123): ...`; push early; open a draft/early PR with `Refs #123`.
- Comment at boundaries: done / next / blockers / evidence.
- Scope or estimate change: dated `plan-change` comment + label + sprint/release/field updates.
- Session ends: checkpoint comment with state, next, branch, PR. Keep status accurate — no silent WIP.

3. REVIEW — DEFINITION OF DONE

- Status **In Review** only when the PR and evidence are ready; PR body uses `Closes #123`.
- Reviewer checks: acceptance criteria, required checks, tests run, docs updated, no secrets/live calls, one task/one PR, deviations recorded.

4. CHECK OUT

- Merge (`gh pr merge --squash --delete-branch`), confirm issue closed, Status **Done**.
- Post check-out: acceptance checked, commits/PR, tests/gates, evidence, deviations, follow-ups, parent updated.
- Update the parent sprint/release tracker if exit criteria are affected.

CLI SHORTCUTS

```
node scripts/adopt/cli/task.mjs start --issue 123 --owner OWNER --executor agent:session
node scripts/adopt/cli/task.mjs checkpoint --issue 123 --message "Done: ... Next: ..."
node scripts/adopt/cli/task.mjs review --issue 123 --pr PR_URL --evidence "tests pass"
node scripts/adopt/cli/task.mjs done --issue 123 --evidence "npm test 11/11; checks green"
```

Manual fallback: `gh project item-edit` for Status, `gh issue comment` for check-in/out. Full commands: TASK CLI and REFERENCE §4–7.

REQUIRED COMMENT FIELDS

Check-in: Owner · Executor · Branch · Starting HEAD · Scope confirmed · DoR · Evidence planned · Risks/blockers → Status In Progress.

Check-out: Acceptance criteria · Commits/PR · Tests/gates · Evidence · Deviations · Follow-ups · Parent sprint/release updated → Status Done; issue closed.

Templates: check-in · check-out · blocker
