Troubleshooting & audit

v1.0.0-docs.1
target template v1.0.0

> First-response fixes and the audit checklist. Full catalog: TROUBLESHOOTING · HOW TO USE §13.

QUICK TRIAGE

SYMPTOM	LIKELY CAUSE	FIX
`token is missing required scopes`	`gh` OAuth token lacks `project`	`gh auth refresh -s project`
`Could not resolve to a ProjectV2`	Wrong owner/number or token scope	Re-check `gh project list`; refresh scope
`Could not resolve to a node with the global id`	Stale/placeholder item ID	Re-read `gh project item-list`; use fresh ID
Required check stuck/pending	Path-filtered required workflow	Remove path filter; keep required job always-on
Audit: `Resource not accessible`	Missing project token/scope	Fix `TRACKER_TOKEN` scope; never widen blindly
WIP violation	Two In Progress tasks for one owner	Finish/block/defer one; document exception
Parent Done with open children	Closed before children finished	Reopen or record explicit deferral with plan-change
`Config validation fails`	Bad JSON/field/option mismatch	Run validator; fix against config schema
Release published unexpectedly	Missing tag/dispatch/environment guard	Stop and rotate tokens; add guards; dry-run default
Stale docs link	Renamed heading/file	Update relative link or add redirect-safe anchor

QUICK DIAGNOSTICS

```
gh --version && gh auth status
gh project list --owner @me --format json
gh project field-list PROJECT_NUMBER --owner @me --format json
node scripts/github/validate-config.mjs tracker.config.json
node scripts/github/audit.mjs --config tracker.config.json --advisory
```

AUDIT CHECKLIST (10 INVARIANTS)

- ☐ Open release work has milestone + native type.
- ☐ Project fields complete (Release/Sprint for release work; Area/Kind/Estimate; Source for downstream).
- ☐ No Done parent with open children unless deferral is recorded.
- ☐ No In Progress without assignee + check-in.
- ☐ WIP ≤ 1 per owner (or documented exception).
- ☐ Blocked has reason + dependency link.
- ☐ No duplicate/retired labels.
- ☐ Sprint/release Done has exit evidence.
- ☐ Template version pinned; downstream context complete.
- ☐ No secrets in issues/comments/artifacts.

Advisory in CI first; required at release gates once stable. Audit token is project-scoped and never logged.

ESCALATE

Capture exact command, exit code, and sanitized stderr; check TROUBLESHOOTING first. If the tracker itself is deficient, report downstream with pinned version and environment — never include tokens or vulnerability details.
